

FlightPRO[®]

DEPLOY

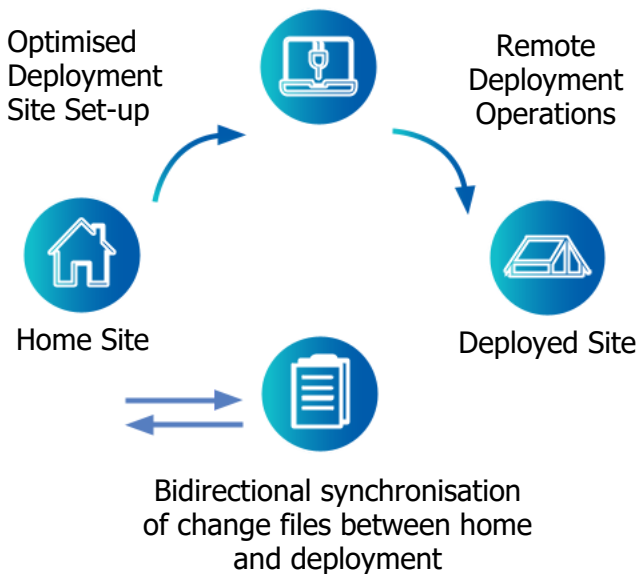

GIVE YOUR TEAM THE FULL POWER OF FLIGHTPRO[®]

Whether you are operating in remote areas, on board a ship or submarine, on exercise, or when subject to severe network interference, FlightPRO[®] Deploy enables critical planning and execution functions for operations to continue, ensuring seamless information flow when away from home base.

Deployed sites have the capacity to allow users to create alternative currency rule sets for personnel. This allows the system to utilise a user's home rule set if there is no deployed set configured or, when a set is configured, utilise a more rigorous currency requirement.

Communication is achieved through a change file, which can be created on-demand and sent by any means as is deemed appropriate for the network security environment. For example, a change file may be sent via secure USB, email, file share or any other method.

This method means that the deployment site can have personnel and assets updated as needed and can pass safety critical information back and forth whilst the site is disconnected. This capability enables a site to remain disconnected for an extended period yet remain fully functional.

Key Features:

- Optimised deployed site set up
- Synchronise data periodically with or without connectivity
- Update both sites, home and deployed, with current and accurate information
- Scheduling and conflict resolution when on deployment

Key Benefits:

- Keep home and deployed sites up-to-date with the latest information, reducing the risk of outdated or incorrect data
- Enhance decision-making and operational efficiency
- Plan deployments more effectively by scheduling tasks and resources
- Detect and resolve conflicts, minimise disruption and delays, and ensure a safe deployment
